

EC / BLDC Motors

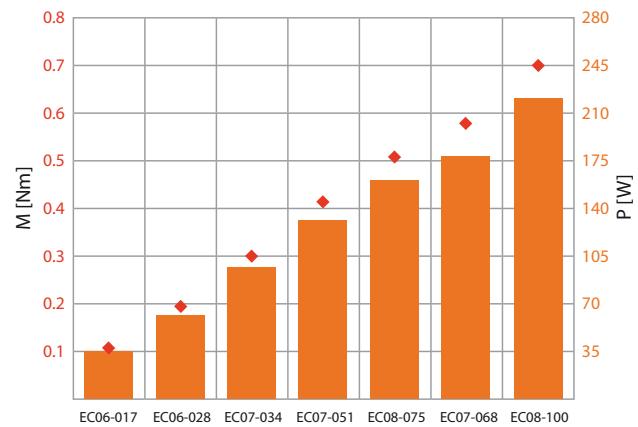

■ Introduction

EC motors

EC motors are also called brushless DC motors. Their construction is equivalent to the construction of a three-phase synchronous motor with permanent magnet rotor. There are no service life limited parts (except for ball bearings), like for example the carbon brush for DC motors. However, the control behavior and characteristic curve of EC motors are similar to those of a DC motor. By means of the simple and robust design and the low requirements of control electronics this motor type can be used with a simplified frequency converter with block commutation. On the inside, a polymer-bonded neodymium magnet ring is employed. With its compact magnet ring it is particularly suitable for higher torques.

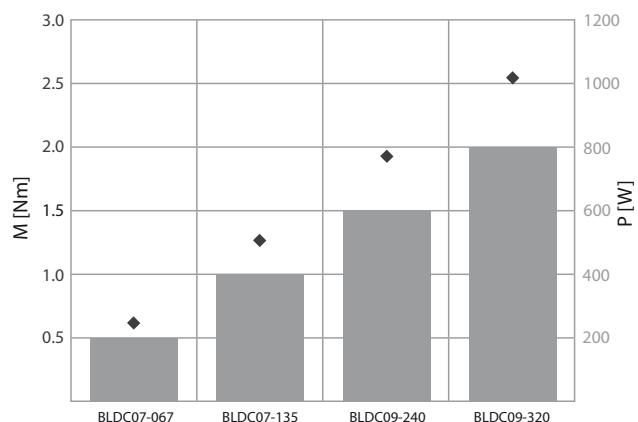

Compared to a common asynchronous motor an EC motor is characterized by a higher power density. In combination with a rotor position detection on Hall basis (RLE) it can also be used as variable-speed drive.

The EC series of Heidrive GmbH consists of three sizes with different lengths and is covering a power range from 35 W to 220 W. This corresponds to a nominal torque of 0.1 Nm to 0.7 Nm. The motors specified here have a triple overload capacity.

BLDC motors

The construction of BLDC motors is very similar to the construction of the previously described EC motors. However, here a highly efficient permanent magnet rotor is used. The utilized sintered rare earth magnet segments (NdFeB) entail a higher degree of efficiency and thus a higher power output. The higher power density of this motor type enables the realization of a more compact size. For BLDC motors a high-order and very robust encoder system on Hall basis (HES) is employed. BLDC motors are particularly suitable for dynamic drives in 4 Q operation.

The BLDC series of Heidrive GmbH consists of two sizes with two lengths in each case and is covering a power range from 200 W to 800 W. This corresponds to a nominal torque from 0.65 Nm to 2.55 Nm. The motors specified here have a fourfold overload capacity.

Encoder

In their standard version, all EC motors are equipped with a rotor position detection (RLE). Optionally the motors of type EC07 (type 306) are also available with a HES encoder.

In the standard version of the entire BLDC motor series the HES encoder is installed.

Overview of encoders that can be used:

■ Hall encoder HES 1

Features:

Motor feedback angle sensor with a resolution of 12 bit (interpolated 14 bit) and numerous initial configurations:

- SSI interface, up to 14 bit, differential and single ended
- Sin/Cos with 1 V_{p-p} or 4.5 V_{p-p}

Application:

- Rotor position detection for EC and BLDC motors
- Resolver replacement for servo motors

General specifications

Sensor principle		Magnetoresistive effect
Maximum speed:		80,000 rpm at 12 bit 10,000 rpm at 14 bit
Signals:	SSI sin/cos	single ended and differential differential, 1 period per turn, 1 V _{p-p} or 4.5 V _{p-p}
Sensor accuracy	sin/cos	± 0.09° at 12 bit
Resolution	SSI	12 bit (14 bit interpolated)

Electrical specifications

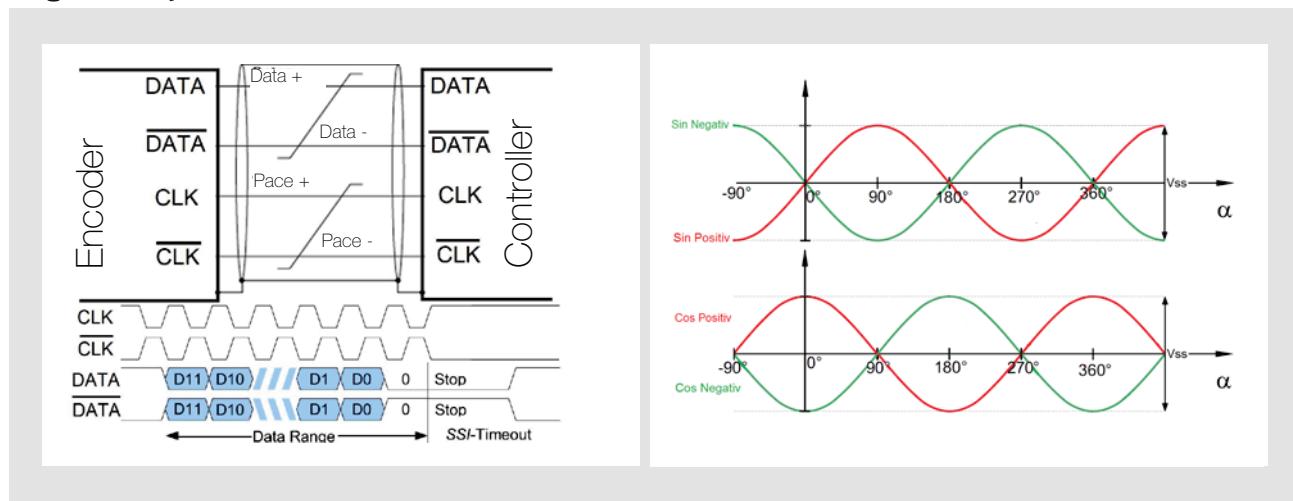

ESD voltage (all pins)		2 kV
Power supply voltage		5.0 V _{DC} ± 10%
Input voltage SSI CLK (RS422)	high	minimum 2.0 V
	low	maximum 0.8 V
Output voltage SSI DATA (RS422)	high	minimum 4.1 V
	low	maximum 0.4 V
Output voltage sin/cos		1.0 V _{p-p} or 4.5 V _{p-p} ± 10%
Output frequency sin/cos		10 kHz SSI 4 MHz

■ Hall encoder HES 2

Features:

Motor feedback angle sensor with a resolution of 10 bit (interpolated 12 bit) and numerous initial configurations:

- SSI interface, up to 12 bit, single ended
- 10 bit incremental ABZ outputs,
differential and single ended
- Hall signal outputs for 2, 4 and 8 pole motors, differential
and single ended

General specifications

Sensor principle		Magnetoresistive effect
Maximum speed:		120,000 rpm
Signals:	SSI ABZ/UW	single ended single ended and differential commutation signals for 2, 4 and 8 pole motors
Absolute accuracy	SSI/ABZ	10 bit ($2^{10} = 1,024$ pulses per rotation)
Relative accuracy	SSI	12 bit ($2^{12} = 4,096$ pulses per rotation)

Electrical specifications
